

Solution Requirements Template

Date: October 3, 2026

Team ID: SWTID-2026-7578

Project Name: Implement Client Script & UI Policy (Incident)

Maximum Marks: 4 Marks

Define Functional and Non-Functional Requirements:
Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR):** Behaviors, functions, or features of the system (What the system should do).
- **Non-Functional Requirements (NFR):** Operation criteria and performance standards (How the system should be).

STEP 1: FUNCTIONAL REQUIREMENTS (FR)

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	Users must authenticate securely into the ServiceNow instance using Multi-Factor Authentication (MFA) and Single Sign-On (SSO).	High
2	Authorization levels	Service Desk Agents have permission to edit incidents; end users have read-only access. Only administrators can bypass form client scripts.	High
3	External interfaces	Integration with internal Active Directory and Email Notification Gateways for automated assignment alert broadcasts.	Medium
4	Transactions processing	When <code>Impact = 1 (High)</code> is selected, the UI Policy sets <code>Assignment Group</code> mandatory and locks <code>Urgency</code> as read-only.	High
5	Reporting	Generates real-time compliance dashboards tracking high-impact incidents that lack assigned fulfillers or violate SLAs.	Medium
6	Business rules & logic	An <code>onChange</code> Client Script sets <code>Urgency = 1</code> on High Impact; an <code>onSubmit</code> script validates <code>Assigned To</code> ; an <code>onCellEdit</code> script blocks list-view editing on <code>State</code> .	High
7	Compliance to laws / regulations	Adheres to ITIL v4 Incident Management standards and ISO/IEC 20000 service governance guidelines.	Medium
8	Other (User Feedback)	Dynamic <code>g_form.addInfoMessage()</code> and <code>g_form.showErrorMessage()</code> calls must present visual notifications before record submission.	Medium

STEP 2: NON-FUNCTIONAL REQUIREMENTS (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Client Scripts and UI Policies must execute smoothly in the user's browser without noticeable lag.	Form script execution time < 200ms per client event.
2	Scalability	The client-side validation logic must handle high concurrent incident creation across peak IT shifts.	Supports up to 500 concurrent active fulfiller sessions.
3	Security & Data Privacy	Prevent unauthorized status skips and list-editing modifications via direct grid manipulation.	100% block rate on list editing for <code>State</code> field via <code>onCellEdit</code> .
4	Reliability & Availability	Ensure scripts load reliably across all major browser engines without throw errors or stopping form interaction.	99.9% uptime and zero unhandled JavaScript console exceptions.
5	Usability & Accessibility	Clear error message boxes must highlight mandatory fields explicitly to assist service agents under pressure.	Complies with WCAG 2.1 AA accessibility guidelines for error callouts.
6	Maintainability & Portability	Scripts must be modularly structured with clear comments, standard <code>g_form</code> APIs, and portable across instances via Update Sets.	100% deployment pass rate across Dev, Test, and Production instances.
